A BRIEF SUMMARY OF SCIENTIFIC HIGHLIGHTS*:

A research program on **Adaptive strategies and population dynamics of polar seabirds under environmental constraints** is undertaken as part of the IPEV Program N° 137 and the PICASO ANR-project (Penguins as Indicators of Climate Anomalies in the Southern Ocean). This program aims at exploring the effects of environmental modifications on population dynamics of these sentinels of Southern Ocean ecosystems: the King penguin *Aptenodytes patagonicus* (Crozet and Kerguelen Archipelagos), the Adélie penguin *Pygoscelis adeliae* and the Emperor penguin *Aptenodytes forsteri* (Adélie Land) using innovative technologies (Automatic or Mobile Identification Systems based on Radio Frequency Identification – RFID, microloggers, etc.). According to the individual and population responses, the EAL-647 'BioSensib' aims to project population dynamics and adaptive capacity of these penguin species at regional and global scales under future environmental change scenarios. Two overwintering field assistants are continuously working in the Crozet Archipelago (king penguin colony) and Adélie Land (Adélie and emperor penguins) since October 2011. Moreover, a new long-term monitoring of a king penguin colony in Kerguelen has been settled during the last summer campaign (2011/2012) undertaken in collaboration with another IPEV Program N° 354.
